Motivation	Example	Generalizing	IPCC	References
0000	0000000	000	000	
The talk				

When is it appropriate for an expert to provide false or misleading information?

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

The plan:

- Motivating the question: the IPCC.
- An illustrative example: Newton's second law.
- Generalizing the example.
- eturning to the IPCC.

Motivation	Example	Generalizing	IPCC	References

The IPCC's presentation of uncertainty

The IPCC generally avoids precise / quantitative probabilities in their reports.

Equilibrium climate sensitivity is likely in the range 1.5° C to 4.5° C (high confidence), extremely unlikely less than 1° C (high confidence), and very unlikely greater than 6° C (medium confidence). (IPCC 2013, 16)

Probabilities are inappropriate for "expressing our current knowledge about climate change." (Betz 2007, 2)

"Though [precise probabilities] may be desirable, further reflection may reveal that the requirements [on their justified use] can rarely be met when it comes to the predictions of greatest interest to decision makers." (Parker 2011, 996)

Precise probabilities "should not be used in the climate context." (Katzav et al. 2021, 2)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Motivation	Example	Generalizing	IPCC	References
00●0	0000000	000	000	
Why not?				

Because scientists / experts should only present information that they *know* to be accurate, and in climate science, we don't know that the precise probabilities are accurate.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Motivation	Example	Generalizing	IPCC	References
000●	0000000	000	000	
Inevitability				

When communicating from a position of expertise, approximations and idealizations are inevitable.

This means that it's inevitable that the communication will present the audience with information that is false or misleading.

C		C			

Some presentations of Newton's laws

We know objects can only accelerate if there are forces on the object. Newton's second law tells us exactly how much an object will accelerate for a given net force.

$$a = \frac{\Sigma F}{m}$$

To be clear, a is the acceleration of the object, ΣF is the net force on the object, and m is the mass of the object.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

[Wait, I thought Newton's second law was F=ma?]

- Khan Academy (2022)

Motivation	Example	Generalizing	IPCC	References
	000000			

Some presentations of Newton's laws

Newton's second law of motion: If a net external force acts on a body, the body accelerates. The direction of acceleration is the same as the direction of the net force. The mass of the body times the acceleration of the body equals the net force vector.

In symbols,

$$\sum \vec{F} = m\vec{a}$$
 (Newton's second law of motion) (4.7)

- Young, Freedman, and Ford (2008, 117)

0000	000000	000	000	References		
What Newton actually says						

"A change in motion is proportional to the motive force impressed and takes place along the straight line in which that force is impressed."

DECOUVERTE d'un nouveau principe de mecanique, par M. euler.

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Three principles: $F_x = ma_x$, $F_y = ma_y$, $F_z = ma_z$.

- Euler (1752, 196)

Historical	views			
Motivation	Example	Generalizing	IPCC	References
0000	0000●00	000	000	

Pourciau: "Principia's second law" is that the deflection generated by force F is the same regardless of whether the body being acted upon is moving or at rest. (Pourciau 2006)

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへで

Motivation	Example	Generalizing	IPCC	References
0000	00000€0	000	000	
The point,	part 1			

Equating "Newton's second law" and F = ma is false or at least misleading.

Leads the audience to be ignorant:

- of Newton's actual second law.
- **2** of post-Newton debates about the foundations of physics.
- **o** f Euler's contribution to mechanics.
- of the practice of revising and reformulating scientific laws.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Motivation	Example	Generalizing	IPCC	References
0000	000000●	000	000	
The point,	part 2			

Nevertheless, simplification in this case seems both inevitable and worthwhile.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Equating "Newton's second law" and F = ma is useful for efficiently teaching the relevant physics.

(Compare Lackey (2007) and McKinnon (2015).)

0000	0000000	●00	000	
Main takeaw	ау			

Whether an expert should present inaccurate (simplified, idealized, approximate) information depends on their particular communicative goals and context.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

0000	0000000	€00	000	References
Main take	away			

Whether an expert should present inaccurate (simplified, idealized, approximate) information depends on their particular communicative goals and context.

What parts of an expert's testimony should be inaccurate (simplified, idealized, approximate) depends on their particular communicative goals and context.

Motivation OOCO Not always good to mislead

Structurally similar example:

While the peacock flower itself moved easily into Europe, the knowledge of its use as an abortifacient did not. ... If [Caspar Commelin] and others had valued knowledge of how to manage women's fertility, knowledge of the peacock flower and its uses would have quickly spread throughout Europe. But it did not. (Schiebinger 2008, 151)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

The role of	experts			
Motivation	Example	Generalizing	IPCC	References
0000	0000000	00●	000	

Even when everything is going right, experts have to choose where to present accurate information and where to mislead by simplifying or remaining silent.

It isn't enough to point out that a claim is (in)accurate w.r.t. a particular target; the question is whether accuracy towards that target is something the expert should be prioritizing.

Motivation	Example	Generalizing	IPCC	References
0000	0000000	000	o●o	
Interpreting	g the IPCC			

- Helgeson, Bradley, and Hill (2018)

Each circle represents a set of probability functions. "[ECS] is likely in the range 1.5° C to 4.5° C (high confidence)" means that all of the probability functions in the "high confidence" group assign at least .66 probability to 1.5° C < ECS < 4.5° C.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Motivation	Example	Generalizing	IPCC	References
0000	0000000	000	oo●	
The point,	part 1			

Right now, the IPCC preserves accuracy w.r.t. uncertainty at the cost of a more complex (and thus hard-to-understand) representation.

This is a *choice*, and we need to ask whether this choice of what to accurately present is a good one.
